

clarity

Software that changes behavior for the better

Clarity is the first healthcare management software that allows for physicians and insurance providers to see what their patient's consume in-real time.

Clarity is a software project that aims to mitigate the burden of chronic disease in America by applying an intermediary layer of computation behind every food and drug-related transaction made by all individuals in our economy today. We believe that software can and should be capable of changing behavior for the better and we believe that a new paradigm of healthcare prevention software can realize that belief system.

Clarity aims to increase diagnostic accuracy for physicians, reduce the economic burden of chronic disease for health insurer's entitlement population, and protect users from harmful foods and drugs in the marketplace today.
